

# Recursion 1

Happy Makar Sankranti

## AGENDA:

- ✓ What is recursion ?
- ✓ How to write recursion code ?
- ✓ How it works ?

# What is Recursion ?

Function calling itself

## Observations

- 1) Size keeps decreasing
- 2) Similar dolls
- 3) End doll

Solving a problem using a smaller instance  
of the same  
problem

subproblem

## Example: Sum of first N natural numbers

$N \rightarrow$  Natural number  
 $N > 0$

$$\text{sum}(N) \rightarrow 1 + 2 + 3 + 4 + \dots + N-1 + N$$

Sum of all nos till N-1

$\text{sum}(N-1)$

$$\Rightarrow \text{sum}(N) = \underbrace{\text{sum}(N-1)}_{\text{subproblem}} + N \quad \leftarrow \text{Main Logic}$$

### Steps

- 1) Make an assumption  
↳ Decide what your function does & trust that it will do it.
- 2) Main Logic  
↳ Solve your bigger problem using a subproblem
- 3) Base case  
↳ When your recursion stops

Assumption —  $\text{sum}(N)$  gives us sum of all numbers from 1 to N.

sum ( int N ) {

if ( N == 1 )  
return 1

← Base  
Case

return sum ( N - 1 ) + N

← Main  
Logic

}

## Dry Run - sum(N)

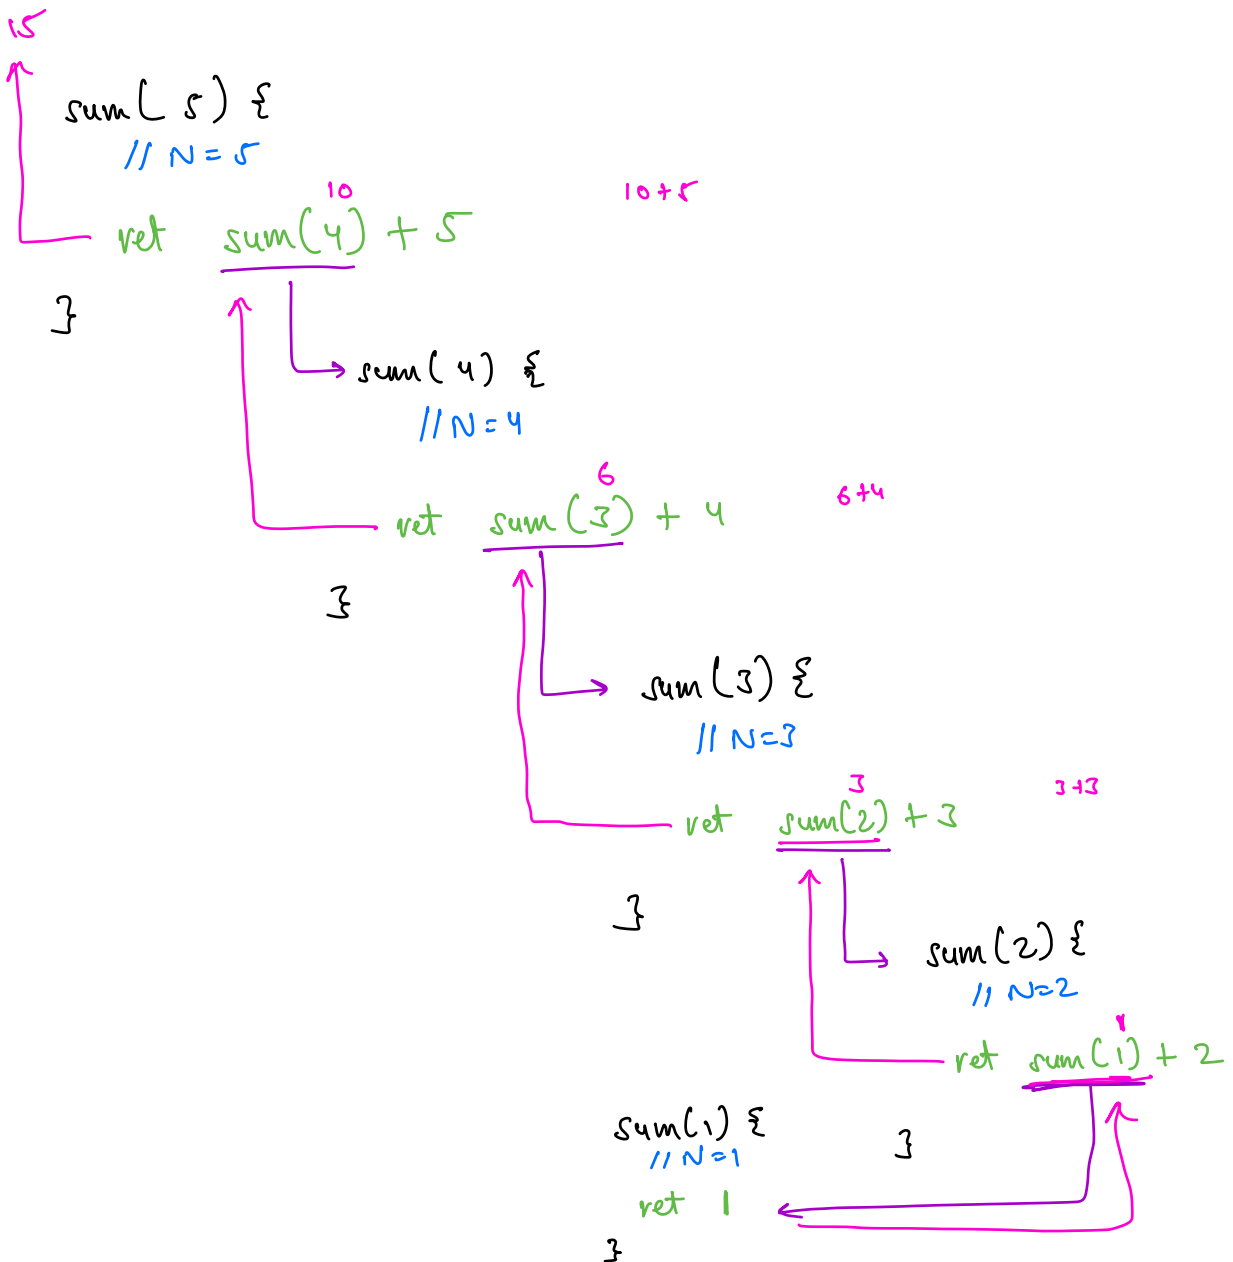

```
sum (int N) {
```

```
    if (N==1)
        return 1
```

```
    return sum(N-1) + N
```

```
}
```

$$\begin{array}{r} N=5 \\ \hline \downarrow \\ 15 \end{array}$$

## Example: Factorial of N

$N!$

$$\text{fact}(N) = \underbrace{1 \times 2 \times 3 \times 4 \dots \times (N-1)}_{(N-1)!} \times N$$

$$\text{fact}(N) = \underbrace{\text{fact}(N-1)}_{\text{Subproblem}} \times N$$

Quiz 1

$$0! = 1$$

$$1! = 1$$

Assumption -  $\text{fact}(N)$  gives us  $N!$

```
fact ( int N) {  
    if (N==0)  
        return 1
```

← Base Case

```
    return fact(N-1) x N ← Main Logic
```

```
}
```

## Dry Run - Factorial

```
fact ( int N) {  
    if (N==0)  
        return 1
```

```
    return fact(N-1) * N
```

```
}
```

N=3

↓

Ans = 6

6  
↑  
fact(3) {  
 // N=3  
 ret fact(2) \* 3

}

↑  
fact(2) {  
 // N=2  
 ret fact(1) \* 2

}

↑  
fact(1) {  
 // N=1  
 ret fact(0) \* 1

}

↑  
fact(0) {  
 // N=0  
 ret 1

}

Base  
Case

Tower of Hanoi

Recursion - 4-5 lines

Loops - 300-400 lines

Break Hill

## Example: Fibonacci Series

Golden Ratio

N = 0 1 2 3 4 5 6 7 8 9 10 11  
1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, ...  
↑ ↑

Given N, compute N<sup>th</sup> fibonacci number

$$\text{fib}(N) = \text{fib}(N-1) + \text{fib}(N-2)$$

if N == 0  
fib(0) = ~~fib(-1)~~ + ~~fib(-2)~~  
return 1

if N == 1  
fib(1) = ~~fib(0)~~ + ~~fib(-1)~~  
return 1

Assumption — fib(N) gives us N<sup>th</sup> fibonacci no.

```
fib(int N) {  
    if (N == 0 or N == 1)  
        return 1
```

← Base Case

```
    return fib(N-1) + fib(N-2)
```

← Main Logic

}

Dry Run — Try on your own

**Q1** Given a number N, print all numbers from 1 to N in increasing order using recursion.

$\text{incPrint}(5) \rightarrow$	$1, 2, 3, 4, 5$		$\text{incPrint}(N)$
	$\text{incPrint}(4)$		$\hookrightarrow \text{incPrint}(N-1)$
	$\text{print}(5)$		$\text{print}(N)$

Assumption —  $\text{incPrint}(N)$  will print all no.s from 1 to N

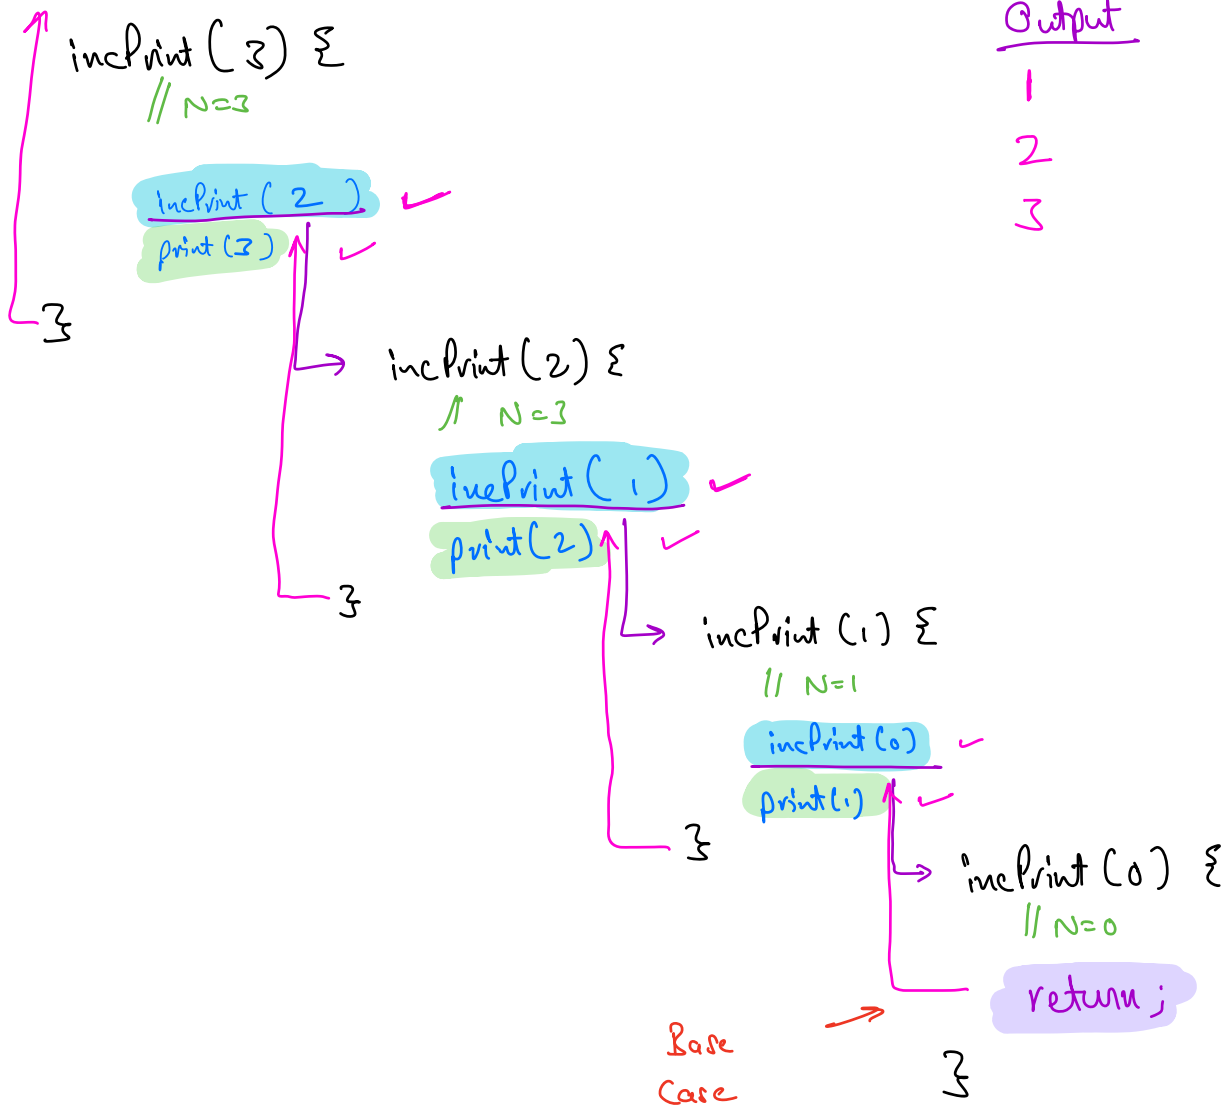

```
incPrint (int N) {  
    if (N == 0) {  
        return  
    }  
}
```

← Base Case

```
    incPrint (N-1)  
    print (N)  
}
```

← Main Logic

}

Q2 Given a number N, print all numbers from N to 1 in decreasing order using recursion.

decPrint(5) → 5, 4, 3, 2, 1

print(5)

decPrint(4)

Todo

One or two lines change in the previous code

# Doubts
